

# Unique «Swiss Technology» sunglasses from Eyerex®

Too much sunlight damages the skin, this is well-known. Sunrays can also cause serious damages to the eyes. Not only invisible UV and infrared rays, but also the visible light can lead to photokeratitis, gray starvation, macular degeneration or tumors. The best protection is a perfect pair of sunglasses. There are some good sunglasses with protection on the market, but perfect sunglasses with protection and a virtually indestructible stability comes from Eyerex®: The quality, the design, the price as well as the application possibilities of our assortment speak for themselves. In addition, it should be mentioned that most of the glasses are developed and produced in Switzerland. I am convinced that due to the very interesting margin and the broad target group a sustainable business can be built up for both sides.

# GEKO

also available with prescription clip

SWISS  MADE

Clip 50159

- best eye protection
- soft, flexible silicone strap
- scratch resistant
- available with prescription clip
- 2 sizes for better fit
- 4 different colours
- nearly unbreakable polycarbonate lens
- UV/IR 100% protection
- CE, EN 166
- incl. microfiber bag

Our GEKO is the allrounder par excellence. Produced from unbreakable polycarbonate with unbeatable accuracy, the GEKO, a quality which is otherwise only achieved with high-priced sunglasses. Swiss made of the finest. «The Swiss sports glasses» par excellence. The GEKO-contour is nestled on the face, causing no irritation in the entire field of view. Available in 2 sizes to ensure maximum comfort for each person. Silicone integrated into the bracket increases the day comfort and prevents slipping of sunglasses with jerky head movements. The weight of 26 grams is barely perceptible. These sunglasses guarantee extreme flexibility.

# FAQ

## Tinting or absorption/transmission

Depending on the strength of the tint (absorption degree), sunglass lenses are classified into so-called antiglare categories and are suitable for different activities:

- **Category 0:** 80 to 100 percent transmittance, almost no light filter, suitable for dark environments such as twilight or cinema.
- **Category 1:** 43 to 80 percent light transmittance, light filter, suitable for cloudy weather.
- **Category 2:** 18 to 43 percent light transmittance, universal light filter, suitable for summer.
- **Category 3:** 8 to 18 percent light transmission, dark filter, suitable for southern latitude for example in a beach holiday
- **Category 4:** 3 to 8 percent light transmission, extremely dark filter, suitable for skiing or in high mountains - no longer suitable for road traffic!

## Quality of sun protection lenses

The quality of a pair of sunglasses does not only depend on the essential UV protection and the features of the eyeglass mount. The imaging quality of the spectacle lenses and the processing of the complete spectacles are also decisive - not least of all are the wearing comfort, the adaptability and thus the professional anatomical adaptation. The UV protection can only be determined by means of special measuring equipment. The layman cannot check whether the spectacle lenses have a protection. There are independent and different tests to recognize inferior spectacle lenses relatively easily:

High quality glasses do not have streaks, bubbles or inclusions. The glass in the frame should not be moved with a slight finger pressure. An object visualized through a sunglass should not move or distort when the glasses are rotated back and forth. Simple test: Hold the spectacles at a distance of a few Centimeters in front of a table edge, then, when looking through one of the spectacle lenses, slowly rotate the glasses clockwise. Through spectacle lenses with poor image quality, the table edge moves or appears distorted. Such inferior spectacle lenses can lead to headaches and dizziness.

## Sunglasses according to the intended use

The degree of tinting and the color of the sunglasses are determined by their intended use. In winter sports, for example, darker glasses are required than in standard use. Different colors of sunglasses also offer better visibility at different times of the day. For example, yellow or orange sun protection filters provide diffuse light for a different (better) contrast on the slopes, during sailing or surfing. In the snow and on the beach the sun radiation is reflected to more than 90 percent, so that the light intensity is unequally stronger. A special light and UV protection is also provided here.
